Rahmat Taufiqurrahman

Product Designer | UX/UI, Design Systems, Front-end Development

Indonesia (GMT+7) | Open to remote work | hello.taufiq.design@gmail.com
Portfolio: taufiqwork.com | LinkedIn: linkedin.com/in/taufiqurrahman05 | GitHub: github.com/taufiqwork

SUMMARY

Product designer who takes products end to end: research-informed problem framing, user flows, information architecture, UI systems and shipped front-end code. Designed for clients in the US, Germany, the Netherlands, Israel and Hong Kong since 2019, on a base of visual and iconography craft going back to 2018. I build with AI agents under written rules and automated checks, so generated work stays inside the product's real constraints.

EXPERIENCE

Product and UX/UI Designer (Freelance)

Self-employed | Remote | Oct 2019 – Present

- Assac Networks, Tel Aviv, Israel (Jul 2024 – Aug 2024): Designed the onboarding icon set and responsive grid system for a security-first mobile app. Worked async with the R&D team lead to keep the design feasible within technical constraints.
- Accuselect, Amsterdam, Netherlands (Apr 2024 – May 2024): Redesigned data-comparison graphs and added explanatory illustrations so non-technical users could understand renewable-energy concepts. Built a 22-icon UI library and introduced an accent colour into the dark theme for a more consistent product.
- Aratum, Hong Kong (Jan 2023 – Feb 2023): Created app icons and logos for 6 cloud applications in a supply-chain SaaS suite, giving the product family one scalable visual language.
- ACCURE Battery Intelligence, Aachen, Germany (Dec 2021 – Jan 2022): Designed and integrated 50 custom icons tied to the battery-lifecycle story of a B2B analytics platform.
- Published icon packs on Flaticon, Freepik and Shutterstock since 2018, featured as Top Icon Pack on Flaticon multiple times.

UX/UI Designer (Contract)

Soaritude | Dallas, TX, US (Remote) | Feb 2025 – Jun 2025

- Only designer on a pre-launch B2B Salesforce template platform, reporting to the CEO and working with Product, Sales and Marketing.
- Designed and built 6 production pages end to end, from Figma prototypes to WordPress (Elementor) with custom HTML and CSS, removing a separate engineering cycle before launch.
- Defined the visual system from scratch: colour palette, type scale, reusable component library, icon set and custom illustrations covering about 80% of the platform.
- Turned the friction the CEO and Sales saw in prospect demos into action-led microcopy, replacing dense text across all 6 pages.
- Fixed 14+ responsive and visual defects with targeted CSS, without external developer support.
- Stakeholders reported clearer sales demos, a stronger brand than baseline Salesforce templates, and faster alignment between Product, Sales and Marketing.

Visual Interface Designer (Full-time)

Berkah Studio | Medan, Indonesia | Oct 2018 – Oct 2019

- Produced premium icon families and visual element sets for global microstock distribution, applying visual hierarchy, layout and colour theory at production volume.
- Earned repeat Top Icon Pack features on Flaticon.

PROJECTS

Tasmi' – Product Designer and Builder

Self-initiated web app, in production | Aug 2025 – Present | Case study: taufiqwork.com/tasmi

- Registration and progress-tracking web app for a Qur'an recitation program, in production with 5 supervisors and the history of 48 participants.
- Ran a root-cause audit of 3 real data-loss incidents and traced them to design-level causes: records keyed by name and schedule instead of identity, and edit state leaking between participants. Each finding became a fixed rule for the rebuild.
- Rebuilt the input flow around user intent (submit, absence, make-up session) after wrong-option selection proved to be the most frequent support issue.
- Owned problem framing, user flows, information architecture, UI system and implementation (SvelteKit, Supabase), including effective-dated records so a schedule change cannot rewrite past attendance.
- Migrated 1,062 records from the first version with every status count matched to the source. Version 1 is 34% faster to log, lost 0 records, and 9 of 11 users preferred it.
- Built with an AI agent workflow I designed: written data rules, approval before changes to sensitive areas, and regression checks that must pass before work counts as done.

Solide – Desktop Design Tool

Self-directed | Jul 2026 – Present | Case study: taufiqwork.com/solide

- Designing and building a desktop design tool (Tauri, TypeScript) that puts layout, vector drawing and motion in one canvas: auto layout, multi-mode tokens, pen and pencil with curve fitting, shape builder, rotation, and hover, press and screen transitions previewed in place.
- Built a local MCP bridge with 65 tools so a designer's own AI can read and build inside the file, with no AI plan or credits from Solide. Each export ships a verifier and a commit gate that blocks a port until it matches the mockup.
- 300+ mockups and 1,670 commits to date.

SKILLS

- Product and UX: End-to-end product design, problem framing, user flows and journeys, information architecture, wireframing, prototyping, design systems, atomic design, UX writing, responsive web and mobile design
- UI and visual: UI components, iconography, illustration, typography, visual hierarchy, brand-aligned visual systems, microinteractions
- Front-end: HTML, CSS, WordPress (Elementor), Figma handoff and developer specs; SvelteKit, Supabase, TypeScript and Tauri (working knowledge)
- AI workflow: Claude Code, Figma MCP, MCP tool integration, agent rules and scoped task design, automated checks for AI output, AI-assisted research synthesis and rapid prototyping
- Tools: Figma, Paper, Affinity, Adobe Illustrator, Adobe Photoshop
- Collaboration: Cross-functional work with CEOs, PMs, Sales, Marketing and Engineering; async remote teams across US, European and Middle East time zones
- Languages: English (professional working), Indonesian (native), Arabic (elementary)

EDUCATION

B.S. Mechanical Engineering

Institut Teknologi Sepuluh Nopember (ITS) | Surabaya, Indonesia | 2017 | GPA 3.50 / 4.00

- Engineering training keeps my design work structured and measurable: systems reasoning, variable testing, and technical conversations with engineers without a translation layer.
